PLAN

Warrnambool Islamic Society Admin Panel Plan

What we use, how it connects to Supabase, and what we do before we start building.

1. The goal

Build an admin panel so committee members can update the website without a developer. Content is stored in one database. The committee edits it in the admin panel, and the public website shows what was saved.

The panel covers: news posts, events, members, team, prayer times, Jumu'ah time, donations, website info (phones, email, Facebook, banner) and admin users.

---

2. Tech stack

Need	Choice
Website and admin	Next.js 16 (already in use). The admin lives at `/admin` in the same repository.
Database, login, photos	Supabase (Postgres, Auth, Storage)
Admin look	shadcn/ui with Tailwind, styled to match the approved prototype
Forms and checks	React Hook Form with Zod
Saving data	Server Actions, then `revalidatePath` so the website refreshes
Azan calculation	The `adhan` library, run on the server
Time zone	`date-fns-tz` set to Australia/Melbourne (daylight saving is automatic)
Hosting	Vercel (already in use)
Package manager	Bun (already in use)

---

3. How the Supabase connection works

- The code uses two keys from Supabase. A **public key** is used for visitors. A **secret key** is used by the server only. Both are stored in `.env.local` and in Vercel's environment settings. The secret key never goes to the browser or to GitHub.

- The website reads content with the public key. Row Level Security (RLS) lets it see published rows only.
- Admins log in with Supabase Auth, using an invitation link and a password. RLS allows only logged-in admins to write.
- Photos go into a Supabase Storage bucket. Anyone can view them, and only admins can upload.
- There is no public sign-up. New admins are invited by email.

> **When someone saves:** the admin form sends the change to Supabase, Supabase checks the person is an admin, the website pages that use that content are refreshed, and visitors see the new version on their next visit.

---

4. Steps before we build

YOU Things only you and the committee can do

- [ ] Create a free Supabase account and a new project. Choose the Sydney region (`ap-southeast-2`), the closest to Warrnambool.
- [ ] Send me the project URL and the public key. Keep the secret key private and add it to Vercel and `.env.local` yourself. I will show you where.
- [ ] Confirm Vercel is connected to the GitHub repository.
- [ ] Get the committee's answers to the four open decisions:
  - [ ] Jumu'ah season dates (which months get 12:30 PM and which get 1:30 PM)
  - [ ] Azan calculation method for Warrnambool
  - [ ] Iqamah: minutes after Azan, or a fixed time, for each prayer
  - [ ] Names and emails of the first admins

CLAUDE Things I check first (reading only)

- [ ] Read the Next.js 16 docs in `node_modules/next/dist/docs/` before writing any route code, as the project's AGENTS.md requires.
- [ ] Open the live Membership and Contact forms in a browser and record their exact fields.
- [ ] List all content in `src/content/site.ts`: 9 news posts, 7 office bearers, mission cards and contact details. Nothing should be lost in the move.
- [ ] Remove the unused WordPress file and its `WP_*` settings.
- [ ] Correct the phone numbers that have an extra "0" after +61.

YOU **Decisions needed**

Question	My suggestion
Sign-in method	Email and password
New membership requests	Show in the Members list and also email the committee
About text and mission cards	Keep fixed in the code for now, to keep this phase small
Jumu'ah time not yet confirmed	Do not publish until the committee confirms it, because sources disagree

---

5. Build order

1. **Database:** create the tables and the security rules.
2. **Login:** invitation sign-in and protected `/admin` pages.
3. **Layout:** sidebar, top bar and Overview page.
4. **Sections, one at a time:** News posts, Members, Team, Website info, Prayer times and Jumu'ah, Events, Donations, Admin users.
5. **Connect the website:** public pages read from Supabase and refresh on save.
6. **Import:** move the existing content from `site.ts` into the database.
7. **Testing:** add, edit and delete in every section. Try writing as a visitor, which must fail. Check Jumu'ah dates at season boundaries. Check on a phone.
8. **Committee guide:** one page in plain language.

6. Data we will store

Table	Holds
posts	Title, summary, text, photo, date, shown on website, shown first
events	Name, date, time, place, shown on website
members	Name, email, phone, date, new or member
team_members	Name, role, photo, order
site_settings	Phones, email, Facebook, top-of-site message
prayer_settings	Azan method, Asr rule, Iqamah rule for each prayer
ramadan_periods	Start and end dates, Isha Iqamah, Taraweeh time
jumuah_seasons	Name, start and end day, time
donation_settings	Page message, bank details, what people can give to
admins	Email of each person allowed to log in

7. Safety rules

- Visitors can read published content only.
- Only logged-in admins can add, change or delete content.
- The membership form on the website can add a new request, but visitors cannot read other people's requests.
- The secret key stays on the server and out of GitHub.
- Photos are resized before they are saved.

8. Next step

Complete the YOU items in section 4 (Supabase project, keys and the committee's answers). While you do that, I can work through my reading-only checks. When you say **"Do it"**, I start on the database tables and login.
